DIMAS EKA ADINANDRA

SOFTWARE ENGINEER

6281232066507 | Indonesia | dimasekaadinandra@gmail.com | linkedin.com/in/dimas-eka-adinandra

SUMMARY

Backend Software Engineer with 4+ years of experience building scalable, production-grade systems from RESTful APIs and microservices to real-time voice processing pipelines and healthcare platforms. Specialises in Go(Primary), Python, PHP and Typescript, with a strong focus on clean architecture (Repository Pattern, Hexagonal Architecture), query performance optimisation, and service reliability. Proven track record of reducing latency, cutting production incidents, and shipping maintainable system that scale. Also contributes to frontend work when needed, enabling tighter cross-team collaboration and faster end-to-end delivery.

TECHNICAL SKILLS

Languages: Go (Golang), Python, PHP, TypeScript, JavaScript
Frameworks & Libraries: Echo (Go), Laravel, HonoJS, AngularJS, gRPC
API & Architecture: RESTful API, Microservices, Repository Pattern, Monolithic and Hexagonal Architecture
Databases: PostgreSQL, Mysql, MongoDB, Redis
Tools: Docker, Git, CI/CD
Practices: Database Query Optimisation, Concurrent Processing, Unit & Integration Testing, Code Review
Integrations: Payment Gateway APIs, RAG Pipelines, AI Workflow Automation

PROFESSIONAL EXPERIENCE

Backend Developer | Venturo (Contract) | Malang **Jul 2024 - Present**

- Designed and Maintained system across the full software development lifecycle from system design and API architecture to production monitoring and long-term maintenance.
- Architected and shipped RESTful APIs and microservices using Go and Echo framework, reducing average API response time by ~40% through targeted PostgreSQL query tuning, indexing strategies, and efficient data access patterns.
- Increased system throughput by ~30% by implementing concurrent processing and optimising resource utilisation across multiple backend services.
- Applied clean architecture principles (Repository Pattern, Hexagonal Architecture) to keep codebases modular, testable, and maintainable as products scaled across 3 concurrent active projects.
- Integrated third-party systems including RAG (Retrieval Augmented Generation) pipelines and Payment Gateway APIs, enabling AI-powered features and secure payment flows.
- Reduced production incidents by ~50% by overhauling logging, monitoring dashboards, and automated test coverage across all backend services.
- Led code reviews and enforced coding standards across 3 concurrent active projects, improving team consistency and reducing review cycle time.

Backend Developer | Aitindo (Contract) | Banten **Nov 2022 - Jun 2024**

- Built backend systems from the ground up database schema design, REST API architecture, and automated CI/CD deployment pipelines supporting a team of 3+ engineers.
- Developed and shipped new features aligned with product roadmap requirements, collaborating with product team and frontend engineer.
- Integrated third-party payment gateway APIs to support secure in-app transactions.
- Diagnosed and resolved critical production bugs, improving system uptime and reducing error rates by ~35% across core services.
- Developed an internal monitoring sub-application to provide real-time observability into primary application health, performance and error rates

Junior Backend Developer | PT Okejek Kreasi Indonesia | Malang **Feb 2022 - Nov 2022**

- Designed and built RESTful APIs for a high-traffic mobile application, improving code performance and reducing response latency through refactoring and query optimisation.

- Integrated third-party payment gateway APIs to process in-app transactions reliably.
- Implemented and shipped new features as part of a cross-functional team, following established coding standards and version control workflows.

PROJECT HIGHLIGHTS

Cavos - Call Operation Platform with AI

- Engineered low-latency backend services in Go and Python to handle real-time voice data processing at scale, consistently meeting sub-500ms latency requirements under concurrent load.
- Designed microservices architecture capable of handling high-volume concurrent voice streams with fault tolerance and horizontal scalability
- Integrated AI-driven workflow automation for QA processing, reducing manual review overhead for operations teams by an estimated 60%.

Lazisnu - Donation & Payment Platform

- Built a microservices-based backend in Go to handle donation transaction processing, service orchestration, and cross-service data consistency across 5+ independent services.
- Designed and implemented clean API contracts for payment integrations and inter-service communication, ensuring reliability and maintainability.

Badr - Healthcare management System

- Developed backend services for vaccine scheduling and inventory management, supporting patient data workflows and healthcare logistics at scale.
- Established consistent API contracts across system components to ensure reliable service communication and future extensibility.

EDUCATION

Diploma in Information Technology (D4) **2017 - 2021**

Politeknik Negeri Malang
